## Wireless Pump Controller

The Smart Water wireless pump controller allows full wireless connectivity to your pump. The system has been designed to be "Set and Forget", which means you can set the system to turn a pump on when your tank level gets low, and turn the pump off once the tank has been filled. There is also an automatic timer function included, and a "connection lost" protection feature. Manual pump control can be activated via the pump controller keypad, or directly via the LCD unit touchscreen. The system can be set to pump from tank to tank (finite source), or from an infinite source such as a stream or bore. The standard system includes a high performance dipole antenna, however for long range applications this can be upgraded to the optional ultra long range Yagi antenna. The pump controller is very simple to operate and even easier to install. Simply plug your pump into the pump controller and then connect the pump controller to the mains power supply and you are up and running. Pump operation is also indicated on the LCD unit by the animated pump icon.

- Fully automatic wireless pump controller
- "Set and forget" design
- Will fill tank to your set level then turn pump off
- When tank reaches your set low level, pump will turn on
- Manual override control available, from LCD or pump controller
- Timer function, pump can be set to run for set periods of time
- Water resistant high grade ABS IP67 wall mounting enclosure
- Automatic stop feature if communications are lost
- Simple installation, plug the pump into the controller and connect to mains
- Can be upgraded to ultra long range option
