## Wireless Tank Level System

The Smart Water Wireless Tank Level system is a complete solution for the monitoring and management of tank water. The system is built from the highest quality materials and is designed for very long service life. The system is simple to operate and extremely easy to install. The starter pack includes all necessary components to get the system operating and includes a comprehensive user guide. The system works by very accurately measuring water pressure (+/-0.3%) and relaying this via a digital wireless link to a touchscreen LCD. The LCD will display basic water level information but will also show "Time to Empty", abnormal usage alerts (potential system leaks), low level alerts and other relevant usage information. Your tank level will automatically calibrate once installed and the system will immediately begin learning and monitoring your usage. The tank unit is solar powered and once installed requires no ongoing maintenance. The system can be upgraded to monitor multiple tanks on the LCD, wireless pump control functionality can be added and system range can be extended with the use of ultra long range Yagi antenna. Smart Water truly is the ultimate in water management technology.
